This comprehensive compilation expands on the data for an Excel-friendly export, drawing from historical and current market analyses as of January 2026. It includes all cryptocurrencies mentioned in the prior discussion that launched since 2017 and remain actively traded (based on criteria like daily volume >\$500,000, market cap >\$10 million, and listings on multiple exchanges). Survival rates for these coins are low overall—under 10% for pre-2020 launches—due to market cycles, regulations, and competition, but those with strong utilities (e.g., DeFi, scaling) persist. For traders, focus on high-liquidity options for long/short positions across networks like Ethereum, Solana, and BNB Chain.

Survival Trends and Market Context

The 2017–2018 ICO era produced thousands of tokens, but most failed amid bear markets and SEC scrutiny. By 2026, emphasis has shifted to AI-integrated, modular, and real-world asset (RWA) projects. Data from sources like CoinMarketCap and Wikipedia timelines confirm ongoing activity, with volumes fluctuating based on trends (e.g., memes like PEPE spike during hype). Risks include regulatory changes (e.g., EU MiCA) and volatility in newer coins.

Trading Implications and Outlook

Prioritize coins with cross-network support for opportunities on your platform. By 2026, AI (e.g., FET) and modular (e.g., Celestia) projects lead trends, with stablecoins dominating volume. Monitor X for sentiment-driven swings (20–50% volatility). This data is self-contained but verify real-time via CoinGecko or similar.
